I Objective and request

MFPA Leipzig GmbH was ordered by Hilti AG to assess the load bearing behaviour of bonded anchors HAS-D with injection system Hilti HIT-HY 200 under tensile loading and one-sided fire loading according to the standard-time-temperature-curve (STTC) according to [N1]. The assessment bases on results of fire tests for the failure mode "steel failure".

The document at hand summarizes the characteristic tensile load bearing capacities. For details, please see [G1].

II Description of the construction

The injection system Hilti HIT-HY 200 is a bonded anchor for use in concrete constructions, consisting of a mortar cartridge, an anchor rod with cones as well as a hexagon nut and a washer. Figure 1 shows a principle picture of the anchor geometry.

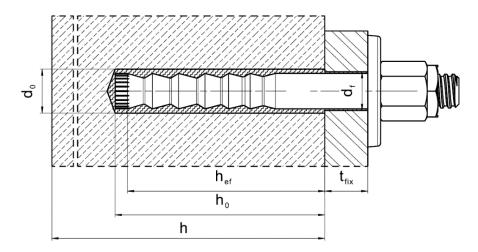

Figure 1: Injection system Hilti HIT-HY 200 with anchor rod HAS-D: On-site geometry

Load transmission mainly occurs due to the mechanical toothing of the cones within the injection mortar as well as, in addition, a combination of cohesion and friction forces in the anchorage. The bonded anchors are approved for the use under static, quasi-static and fatigue loading in reinforced and unreinforced normal concrete of the strength class of at least C20/25 and at most C50/60 according to [N2]. The required diameter and depth of the drill hole as well as the minimum component thickness are specified for each anchor in [P1, P2]. In the course of installation of the bonded anchors, the manufacturers' instructions have to be obeyed (see [P1, P2]).

According to [P1, P2], the anchor rods are produced using galvanized steel according to [N3]. For a detailled product description and further information with respect to the scope of application, please see [P1, P2].

IV Assessment of the performance

1 Steel failure

Basing on experimental results and respective evaluations (see [G1]), Table 1 shows the characteristic tensile load bearing capacities $N_{Rk,s,fi}(t)$ for steel failure.

| | fire duration [min] | | | |
|---------------|---------------------|------|------|------|
| | 30 | 60 | 90 | 120 |
| HAS-D 100 M12 | 5.80 | 3.80 | 1.81 | 0.81 |
| HAS-D 125 M16 | 7.62 | 5.81 | 4.01 | 3.11 |
| HAS-D 170 M20 | 13.02 | 9.75 | 6.48 | 4.84 |

V Special notes

The assessment at hand is valid for bonded anchors HAS-D with injection system Hilti HIT-HY 200 manufactured by Hilti AG which are installed according to the manufacturers' instructions in [P1, P2]. The mechanical loading may not exceed the load bearing capacity in ambient climate specified in [P1, P2].

The load bearing capacities specified in the framework of the document at hand are determined for one-sided fire loading according to the standard-time-temperature-curve. According to [N4], the values may also be used for multilateral fire loading when the edge distance of the anchor is $c \geq 300mm$ and $c \geq 2 \cdot h_{ef}$.

The load bearing capacities specified in the framework of the document at hand are determined for centrical tensile loading in the anchors longitudinal direction. According to [N5], the values may be transferred to tensile loading perpendicular and diagonal to the axis of the anchor on the safe side.

The assessment at hand is valid for constructions of reinforced or unreinforced normal concrete of the stength class \geq C20/25 and \leq C50/60 according to [N2], which exhibit at least the same fire resistance class as the utilized anchors. The design of the concrete construction has to be carried out according to [N6].

The load bearing capacities specified in the framework of the document at hand are determined assuming that no explosive concrete spalling occurs and are only valid under this condition. Evidence on the prevention of explosive concrete spalling is given in [N6], chapter 4.5.
